Sequence
                             therapeutic and diagnostic application in insulin-dependent diabetes mellitus patients
Disclosure; Fig 3; 53pp; English.
The sequence given is a glutamic acid decarboxylase (GAD65). GAD65 can be used for the diagnosis and therapy of patients with autoimmune diseases, esp insulin-dependant diabetes mellitus (IDDM) and "stiff man" syndrome. It is possible to use either the entire GAD65 protein or polypeptide fragments of it for the immunological detection of autoantibodies to GAD65 which are indicative of IDDM and other auto-immune diseases. The production of this sequence by recombinant DNA technology allows large scale production of eukaryotic GAD65 in its native from without the need for separation form other proteinaceous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        claim 11; Page 9; 12pp; German.

W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    65 kD Glutamic acid decarboxylase peptide fragment III.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New soluble fragments of glutamic acid decarboxylase protein used for the diagnosis and treatment of insulin dependent diabetes mellitus and stiff man syndrome. Disclosure: Fig. 1; 73pp; English syndrome. The amino acid sequences of human GAD65 (R59516) and rat GAD65 (R59517) were determined. New soluble fragments of GAD65 (R59518-25) were prepared by deletions full timit solubility. Different fragments contain epitopes for different classes of GAD65 autoantibodies.
or MICA2. These mutants also have some N-terminal modifications to improve solubility. Sequence 544 AA;
                                                                           Disclosure; Fig. 1; 73pp; English.

The amino acid sequences of human GAD65 (R59516) and (R59517) were determined. New soluble fragments of G (R59518-25) were prepared by deletion/substitution mutagenesis. The C-terminally deleted mutants given are able to recognize IDM autoantibodies having the of MICA4/MICA6, but not those having the specificity
                                                                                                                                                                                                                                                                         New soluble fragments of glutamic acid decarboxylase used for the diagnosis and treatment of insulin dependiabetes mellitus and stiff man syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GAD65 545-585 C-terminal-deleted mutant.

diabetes and stiff man syndrome
Examples: Fig 1; 31pp; English.

This represents a human GAD65 protein sequence. The invention provides soluble fragments of GAD65 that are specifically reactive with at least one class of GAD65 autoantibody. The fragments are substantially free of N-terminal amino acids that would otherwise limit solubility. Different fragments contain different epitopes for different classes of GAD65 autoantibodies. These fragments are used in the methods of the invention for detection of GAD65 autoantibodies. The methods are used for monitoring insulin-dependent diabetes mellitus (IDDM) and

65 kD human glutamic acid decarboxylase isoform.
65 kD glutamic acid decarboxylase; human; GAD65;
neuron; central nervous system; type I diabetes;
T_cell; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           stiff-man syndrome Disclosure; column 27-30; 30pp; English.

This sequence represents the human glutamic acid decarboxylase protein This sequence represents the human glutamic acid decarboxylase protein GAD65. The invention relates to soluble fragments of a GAD65 protein that are specifically reactive with a GAD65 autoantibody (AAb), where the fragment is at least 99% pure and the AAb binds to a conformational epitope of the fragment. The soluble GAD65 fragments can be used to distinguish between insulin-dependent diabetes mellitus (IDDM) and stiff man syndrome. They can also be used for diagnosis and treatment of IDDM and stiff man syndrome. The fragments can distinguish different temporal stages in the progression of IDDM.

Sequence 584 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LT 8

Bisclosure: Fig 1; 28pp; English.

This sequence represents the 65 kD isoform of human glutamic acid decarboxylase (GAD65). GAD is an enzyme expressed in the beta cells of the pancreas, and in neurons of the central nervous system. There are two isoforms of GAD, a 67 kD isoform, and GAD65. Immunodominant regions of GAD65 have been identified in Type I diabetic patients. Fragments of GAD65, and analogues of the fragments, are used in the methods of the GAD65, and analogues of the fragments, are used in the methods of the invention. The methods are for detecting or treating diabetes or a predisposition to diabetes. The peptides can also be used for ameliorating an autoimmune response in a patient. Alteration of the native peptides with selective changes of crucial residues can induce unresponsiveness or change the responsiveness of antigen-specific and do not cause proliferation of the corresponding native beptide-specific T cells. The peptide analogues compete for binding to MHC sequence 585 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Best Loc

A modified human glutamic acid decarboxylase (GAD) (W14915) has the native lysine residue at amino acid position 39 replaced by arginine. It is obtd. by site-directed mutagenesis (see also T64561) of native human GAD65 cDNA and expression of the mutant DNA (T64560) in transformed host cells. Lys-396 is critical for enzyme activity. By replacing it with an amino acid incapable of Sthiff
                                                                                                          disorders such as insulin-dependent diabetes mellitus (IDDM) and other diseases, e.g. neurological diseases, esp. in individuals having a genetic predisposition for IDDM or with an increased

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   insulin dependent diabetes mellitus
Disclosure; Fig 2; 45pp; English.
The sequence is that of human pancreatic islet glutamic acid
decarboxylase (GAD) which is used to test biological samples for
the presence of autoantibodies to human GAD. It can also be used
to remove antibodies against GAD from plasma in order to treat an
autoimmune response to GAD, e.g. in insulin-dependent diabetes melting
(IDDM), and may also be used to induce immunological tolerance to GAD
by giving GAD that specifically binds the GAD receptor on immature T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Foster DC, Grubin CE, Hagopian W, Karlsen AE, Lernmark A, OHara WPI; 92\text{-}415789/50. Example 1; Fig 3: 10bp; English.

Q86481 and Q86482 encode R71733 and R79105, rat and human glutamic acid decarboxylase (GAD65) respectively, from which the GAD65 fragments described in R72561-R72298 were derived. These fragments can be used to detect autoantibodies against GAD, e.g. to diagnose and treat GAD-related autoimmune disorders, such as insulin dependant diabetes mellitus or stiff man disease.

Claim 8: Page 40-44; 62pp; English.

A human islet cDNA library was screened for colonies containing GAD cDNA using probes (given in Q86047-49) based on conserved internal and N- and C-terminal regions of cat, rat and mouse brackers and series obtained by PCR-RACE. The entire GAD. Full-length clones were obtained by PCR-RACE. The entire sequence of the human islet GAD cDNA is given in Q86046 and the

Lys-396 is critical for enzyme activity. By replacing it with an amino acid incapable of Schiff base formation, immunoreactivity is maintained but enzyme activity is reduced or lost, so minimising the risk of toxicity. The modified GAD can be used to treat and/or prevent autoimmune disorders such as insulin-dependent diabetes mellitus (IDDM) and other diseases, e.g. neurological diseases, esp. in individuals having a genetic predisposition for IDDM or with an increased antibody titre against GAD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Predicting the clinical course of diabetes in patients winon-insulin dependent diabetes mellitus - by detecting the presence of auto:antibodies to human islet cell glutamic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hagopian W,

Database:

pir62 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 29.232; Variance 44.473; scale 0.657

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

COMMENT This enzyme (GAD) catalyzes the formation of an inhibitory
neurotransmitter, gamma-aminobutyric acid, from L-glutamic aci
it has several isoforms, each encoded by a separate gene. GAI
also been implicated as an autoantigen in autoimmune disease
                                                                                                                                                                                                                                                FEATURE

NT This enzyme (GAD) catalyzes the formation of an inhibitory
neurotransmitter, gamma-aminobutyric acid, from L-glutamic acid;
it has several isoforms, each encoded by a separate gene.

IFICATION #superfamily human glutamate decarboxylase
carbon-carbon lyase; carboxy-lyase; phosphoprotein; pyridoxal

MMENT This enzyme (GAD) catalyzes the formation of an inhibitory
neurotransmitter, gamma-aminobutyric acid, from L-glutamic acid;
it has several isoforms, each encoded by a separate gene.

LASSIFICATION #superfamily human glutamate decarboxylase
carbon-carbon lyase; carboxy-lyase; phosphoprotein; pyridoxa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

COMMENT This enzyme (GAD) catalyzes the formation of an inhibitory neurotransmitter, gamma-aminobutyric acid, from L-glutamic aci it has several isoforms, each encoded by a separate gene. GAD also been implicated as an autoantigen in autoimmune disease stiff-man syndrome and insulin-dependent diabetes mellitus.

This enzyme (GAD) catalyzes the formation of an inhibitory
neurotransmitter, gamma-aminobutyric acid, from L-glutamic acid;
it has several isoforms, each encoded by a separate gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ##molecule_type mRNA
